Getting Started - Establishing a Web Presence

NOTE: *If you have had a previous ITWP course you will be updating the index.htm (Web Program Homepage) document to link to and include ITWP 1150.*

Please check your directory structure once you are logged into the Web server. Some folders may be named using all uppercase letters some may be named using lowercase letters. You will have to adjust your file path accordingly.

This is a new course as of Winter 2021, so you may not see the ITWP 1150 folder within your account folder if you've had an ITWP course prior to Winter 2021. If this is the case, you will have to create an itwp1150 folder within the public_html folder using FileZilla.

Please watch the following video at https://macomb.techsmithrelay.com/xiQ3 to see how this is done if you need a refresher.

Please note that the recommended IDE for this course is Visual Studio Code (VS Code).

Section 1.0 – Student Server Account Setup PDF

Please refer to the **Liquid Web Server FTP Setup PDF** in the **Instructional Documents & Resources** area under **Modules** for instructions on how to connect to the web server and how to establish your login credentials for the Liquid Web server so you will be able to upload your work to the server.

Within the **Liquid Web Server FTP Setup PDF,** you will find the information that you will need for setting up your connection to the web server. You can use the **Quickconnect** method or set up a more permanent site using the Site Manager, both methods are explained within the PDF document.

NOTE: *If you would like to use a different FTP application other than FileZilla, please feel free to do so. You may have to adjust the settings to be able to connect to the web server based on the FTP application you are using.*

Section 1.1 - Setting up a Directory Structure

It's important to create a directory structure on your computer or storage device that will mirror the directory structure on the web server you will be using for the web program. This will make it easier to keep track of things when uploading your files to the web server.

1. Create a folder on your storage device (e.g., computer, the cloud, Dropbox), naming it whatever you wish. I recommend using the same username as you established for logging into the web server, but it's up to you.
2. Inside this folder create another folder, naming it **public_html**
3. Inside the **public_html** folder create another folder naming it **itwp1150**
    a. For example, I created a folder titled **jwanner** on my computer desktop along with a folder titled **public_html** and inside **public_html**, I created another folder named **itwp1150** to mirror how my account folder is set up on the web server.

b. All the assignments for this class will reside in the **itwp1150** folder unless otherwise instructed. The only exception will be the **index.htm** file which will **always reside within the main level of the public_html folder**.

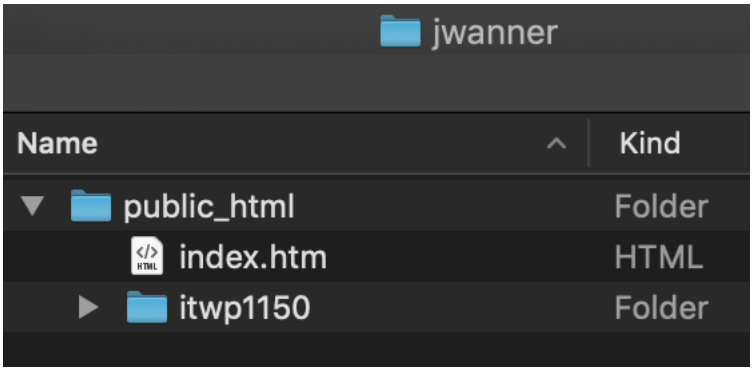

Figure 1: *The public_html level of your student folder as it appears on your flash drive or computer. The* ***index.htm*** *file should always reside inside public_html.*

Section 1.2 - Creating a Web Program Homepage

NOTE: If you've had previous ITWP courses and already have a Web Program homepage (index.htm) created, please go to the next section.

1. Create a simple homepage for the Web courses using **VS Code**. A simple but effective page is shown below. *(Please note that this template uses the HTML5 DTD. The page can be duplicated in VS Code with appropriate changes being made. Don't forget to replace "Your Name" with your actual name.)* If you want to be more creative, please do! Just be sure your web page successfully validates and is functional.

2. Type and save the following code shown below as **index.htm** in the root folder of **public_html** (not itwp1150) of your account folder on the web server. **Be sure to replace the words "Your Name" to include your actual name.**

   NOTE: *If you have already created a web program homepage for the Web courses (index.htm) for ITWP1000 or other ITWP courses, you will simply just be creating a hyperlink that links to your ITWP course homepage within the appropriate folder on the server.*

3. Check your work in a web browser. FYI, the basic code below as is successfully validates for the HTML5 DTD. It's important that you validate all your web documents before publishing them to the web and that they validate successfully. **Web page validation using the W3C online validation tool (http://validator.w3.org/) was covered in previous ITWP courses.**

```html
<!doctype html>
<html lang="en">
<head>
<meta charset="UTF-8">
<title>Web Program Homepage</title>
    <style>
        h1, h2 {
           text-align: center;
        }
    </style>
</head>

<body>
    <header>
        <h1>Macomb Community College <br>
            Web Development Degree Program</h1>
        <h2>Your Name</h2>
    </header>
    <main>
        <hr>
        <h3>Web Program Courses</h3>
        <ul>
            <li>ITWP-1000</li>
            <li>ITWP-1050</li>
            <li>ITWP-1100</li>
            <li>ITWP-1150</li>
            <li>ITWP-1450</li>
            <li>ITWP-2300</li>
            <li>ITWP-2600</li>
            <li>ITWP-2750</li>
        </ul>
    </main>
    <footer>
        <p><!-- validation goes here--></p>
    </footer>
</body>
</html>
```

Figure 2: *Source code for the Web Program homepage.*

The above code produces the following web page when viewed within a web browser (shown below). Be sure to include the validation link(s) and style as you wish.

Macomb Community College
Web Development Degree Program

Your Name

Web Program Courses

- ITWP-1000
- ITWP-1050
- ITWP-1100
- ITWP-1150
- ITWP-1450
- ITWP-2300
- ITWP-2600
- ITWP-2750

Figure 3: *Web Program homepage viewed within a web browser.*

Section 1.3 - Creating your Course Homepage

Create a simple class homepage for the ITWP1150 course using **VS Code**. A screen shot of a simple but effective page is shown below. If you want to be creative with your page, go right ahead! Have fun with it! I will leave the creativity up to you. But, be sure **it validates successfully and is functional**! **You must validate for the HTML5 DTD.**

- Be sure to include a link back to your **Web Program Homepage**. Relative linking must be used.
- Adjust the list of assignments for each week as appropriate.
- Save the document as **home.htm** **<u>inside the itwp1150 folder</u>**. This is part of the directory structure you set up in Section 1.1. The home.htm file will also be uploaded to the itwp1150 folder located on the web server.

React Course Homepage

Web Program Homepage

Module 1
- Homework 1a
- Homework 1b

Module 2
- Homework 2

HTML5 Validation

Figure 4: *React course homepage viewed within a web browser.*

Please note that this a **12-week course consisting of 12 course Modules**, only two modules are shown in the screen shot above for demonstration purposes. Your course page should contain 12 modules and be updated appropriately each week with links to your work. Some modules have multiple assignments due.

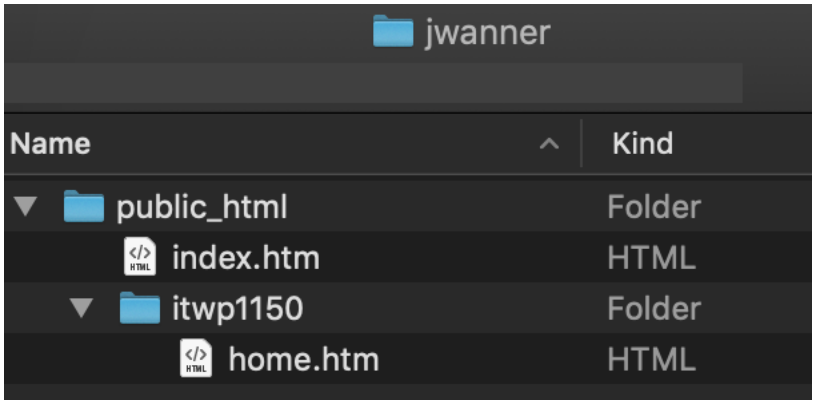

Figure 5: *An example of the file structure for this course on your storage device.*

Section 1.4 - Hyperlinking

Create a link from your **index.htm** document located in the root folder of the **public_html** within your account folder to the ITWP1150 course homepage (**home.htm**) located inside the ITWP1150 folder. Relative linking must be used.

1. Open the **index.htm** file within VS Code.
2. Create a hyperlink that links index.htm to the **home.htm** file inside the itwp1150 folder. For example:

<a href="itwp1150/home.htm">ITWP1150</a>

3. Save your work.

Please note that if you name your course homepage something other than home.htm, the you will need to adjust the target filename accordingly within the file path.

Section 1.5 - Validating your Work

Within the **W3C Validation Process Module** in our Canvas course, please review and complete the validation process steps outlined within the **W3C Validation Process Instructions** PDF document for each web page created for this assignment. Videos are also available as a supplement to the instructions.

NOTE: You may have to Google the meanings of the some of the error codes you receive. Read the description of the code carefully to correct your error(s) if you have any. Post any obscure errors to the **Help Forum** so your classmates can help out. Please do not email me with validation issues, I want them posted to the forum so everyone can participate – that's where the learning takes place. The process can sometimes take longer than development so please plan for it.

Be sure that **ALL** of the files used to complete this assignment are included within the project folder and that the folder is correctly uploaded to the ITWP1150 folder within your student account folder on the web server.

Section 1.6 - Uploading your Files

Please refer to the **Liquid Web Server FTP Setup PDF** in the **Instructional Documents & Resources** area under **Home** for instructions on how to connect to the web server and how to establish your login credentials for the Liquid Web server so you will be able to upload your work to the server.

1. Launch FileZilla or the FTP application of your choice.
2. Connect to the web server using the instructions from the **Liquid Web Server FTP Setup PDF**. The PDF will explain how to establish your **login credentials** for the web server and how to set up the **connection** within FileZilla.
3. You SHOULD be at the root directory (the main level). Double click on the folder named **public_html** which is the main account folder for the web program.
4. Inside the **public_html** folder you will see a list of folders for the web program courses, an index.htm HTML file, and a cgi-bin folder.
5. In the left pane of FileZilla, navigate to your folder on your computer so that the file named **index.htm** that you created and saved earlier, is visible.
6. Click on the filename to highlight it.
7. Making sure that are inside the **public_html** folder and you can see the file named **index.htm** in the right pane, upload the file from your computer to the web server by dragging and dropping the index.htm file into the public_html folder and overwriting the old index.htm file, or right+click on the file and click Upload from the submenu.
8. If asked if you want to overwrite, please do overwrite so that the new information becomes available.

9. Double-click the **ITWP1150** folder on the right-side pane to make that folder active.
10. In the left pane, navigate to your ITWP1150 folder on your computer so that the file named **home.htm** that you saved earlier is visible.
11. Just as you did for your index file in the steps above, upload the **home.htm** file to the **ITWP1150** folder on the student server.
12. Launch your favorite web browser and enter your web homepage URL:

    http://*your-userid*.macombserver.net
    (don't forget to insert your userid where it reads "your-userid")

    Example: Justin Verlander's URL would be: http://verlanderj456.macombserver.net

13. You SHOULD see the new index page you just uploaded that displays the links to all the ITWP folders. If you see the default index page, double check that you uploaded the new index file to the correct folder.
14. Verify that your link works by clicking on ITWP1150. You SHOULD see the **home.htm** page you create earlier.
15. Logout of FileZilla.

Section 1.7 - Submitting your Work

Please note that you always need to notify me that your work is ready to be graded through the appropriate assignment area in Canvas each week. Missing notifications will not receive credit.

1. Log in to the Canvas classroom.
    a. Click on the **Home** tab in the side navigation bar.
    b. Click on **Module 1** and locate the **Module 1 – Establishing a Web Presence** link**.**
    c. In the comments area let me know you are finished and your assignment is ready for grading, "my work is ready for grading." will do just fine.
    d. **Supply me with your course homepage URL,** *e.g., http://verlanderj456.macombserver.net/itwp1150/home.htm*
    e. Please note that you will not be attaching your completed assignment to the assignment area but rather uploading it to the web server where I will access it. It is not necessary to attach any files. **The file attachment option has been disabled since you will be uploading your work to the student web server.**
    f. Once you have submitted notification and your work has been graded, you cannot resubmit for a better grade, the original grade remains as is.

Please be sure to test the links to your work. Test access to your assignment from your course homepage to be sure everything is correctly hyperlinked and in working order. If I cannot access your work, I cannot grade it. The result will be a zero for the assignment.

Please review the Weekly Schedule within this week's Module for other required assignment(s) due this week.

Grades will be assigned within the limits of the grading policy. Points listed within the Value column of the rubric below are the maximum number of points you can receive if your work is 100% correct. Incorrect work may receive zero through the maximum point value range listed within the Value column. ***Late work is not accepted. The appropriate assignment area(s) will be closed at the time of assignment's due date. Email attachments of any assigned submitted work will not be accepted.***

Please review the course Late Policy within the Syllabus (First Day Handout).

Establishing a Web Presence Grading Rubric

Criterion	Value
Created and/or updated Web Program homepage (index.htm) at the root level of your student account folder. ITWP1150 should be hyperlinked and actively link to home.htm inside the ITWP1150 folder in your student account folder.	2
Created course homepage residing within the ITWP1150 folder in your student account folder on the web server.	2
Hyperlinks are active and correctly link to their appropriate areas. Syntax must be correct.	3
Appropriate title tag used within each webpage. Syntax must be correct.	2
Course homepage contains a functional link back to the Web Program homepage. Syntax must be correct.	1
Successfully validated HTML document for the HTML5 DOCTYPE with included and displayed HTML validation link within the footer of the web page using a unique URL as stated in the assignment instructions. A zero will be issued if the validation link is not present. Correctly used and valid HTML5 tags including all the basic structural HTML5 container tags and all required attributes. Correctly used and valid HTML5 tags including all the basic structural HTML5 container tags and all required attributes. The link must be present within each assignment web page and it must display the W3C validation web page indicating successful validation of your document when clicked. Validation must be successful and correct HTML5 syntax must be used to receive the full points.	5
TOTAL POSSIBLE POINTS:	**15**
